PROFILE

First Class BSc (Hons) Cybersecurity graduate with client open-source intelligence (OSINT) investigation experience, supervised web application testing and Python security tooling. Experienced in documenting findings, evidence and risks for technical and non-technical audiences. Seeking a graduate security analyst role.

RELEVANT SKILLS

Investigation & OSINT: Domain/IP research, DNS analysis, SpiderFoot, Shodan, WHOIS

Web Security Testing: Burp Suite Proxy, supervised manual web application testing

Python & Tooling: Python, CLI development, reconnaissance automation, HTML reporting

Networking & Lab: TCP/IP, subnetting, virtual machines; Nmap, Nikto, Hydra (university/lab practice)

Professional: Technical reporting, stakeholder communication, troubleshooting

Languages: English, Arabic, French (fluent)

RELEVANT EXPERIENCE

Cybersecurity & OSINT Intern - ISECOM, Remote

2024 – May 2026

- Used SpiderFoot, Shodan, WHOIS and DNS tools to research online personas and map relationships between domains, IP addresses and online identities.
- Performed supervised manual web application testing using Burp Suite Proxy; confirmed findings included insecure cookie attributes, exposed directories and session-management weaknesses.
- Wrote structured reports setting out findings, supporting evidence, risks and remediation recommendations, and explained findings to senior analysts and non-technical stakeholders.
- Located leaked data using LOLArchiver and assessed identity-related information relevant to client investigations.

Sales Representative - Big Bus Tours, London

Mar 2022 – Jan 2026

- Provided customer support, booking-platform assistance and troubleshooting.

SELECTED SECURITY PROJECTS

Snapstore Security Assessment

Aug 2026

Lab assessment, public report: github.com/salahudeenmatine/snapstore-security-assessment

- Authorised local assessment of a deliberately vulnerable Go, C, Rust and Python service; manual code review supported by AI assistance.
- Reproduced five findings against the running service (SSRF, path traversal, SQL injection, stack buffer overflow, untrusted PATH resolution), each documented with proof and remediation.
- The buffer overflow was proven as a remote crash, not code execution; the PATH finding requires attacker write access to an early PATH directory.

Attack Surface Mapper - Python CLI

Personal project

- Built a Python CLI that automates domain-based reconnaissance: DNS analysis, subdomain discovery, host resolution, port scanning and HTTP security-posture checks.
- Generates HTML reports with rule-based severity ratings.

EDUCATION

BSc (Hons) Cybersecurity - University of West London

2023 – 2026

First Class Honours

BTEC Level 3 Diploma in Applied Sciences - Westminster Kingsway College

2021 – 2023
